

WHAT CAN DERMAL FILLER RHINOPLASTY ACHIEVE?

A non-surgical nose job using dermal filler injections can treat a number of nose concerns:

- Straighten nasal humps and bumps
- Enhance the nasal saddle
- Narrow a broad appearing nose
- Straighten a hooked or slightly crooked nose
- Create a narrower nose tip
- Correct asymmetric noses (especially after botched surgery)

HOW LONG DO THE FILLERS LAST?

- These treatments usually last for up to a year or even longer. Depending on the type and age of the skin, the Hyaluronic acid will begin to dissolve at this time. If the procedure is not repeated, the skin will gradually return to its pre-treatment condition.
- The procedure takes about 20-30 minutes using a very fine needle or cannula. Prior to this, a numbing cream can be used to numb the area and in some cases local anaesthetic is used.
- Results are instant, final results can be achieved after 2-3 weeks.

SIDE EFFECTS

- Minimal redness
- Swelling as well as possible mild bruising at the injection site.
- Other potential side effects will be discussed during consultation.

DERMAL FILLERS

HYALURONIC ACID FILLERS

- The health and appearance of our skin is affected by a number of lifestyle, environmental and biological factors including sun damage, the weather, pollution, hormonal fluctuations and smoking. Therefore, our skin is under constant attack and it is of little wonder that it begins to lose its elasticity and hence takes on a more loose, less taut appearance
- Dermal filler treatment is used to plump up the skin and give it a more fuller, smoother appearance by delicately filling out permanent grooves and deep lines in the face.
- Dermal fillers are made from Hyaluronic acid which is in fact a naturally occurring component of the skin. It has the remarkable ability to absorb more than 10 times its weight in water, thereby adding volume and creating a naturally lifted appearance.
- The dermal filler injectable products we use at the Vitality Fountain Clinic and Source Medispa in Nairobi include Restylane and Juvederm which are the most established and safest international brands.

AREAS COMMONLY IMPROVED BY DERMAL FILLER TREATMENT INCLUDE:

1. Nasolabial folds (the grooves on the lower face between the corner of your nose and mouth)
2. Lifting Cheeks
3. Volume enhancement and contouring of the lips
4. Fillers under eyes (tear troughs)
5. Lipstick lines
6. Jowls and drawn down corners of the mouth
7. Liquid facelift (6-point face lift)
8. Nose correction (liquid rhinoplasty)
9. Deep frown and forehead lines
10. Temples

LIP ENHANCEMENT

- Lip fillers should result in fuller, more feminine and beautiful appearance of your lips, as dermal fillers can balance out the perfect proportions of your upper and lower lips.
- Dr Stasch aims to give you the results you want – a thorough consultation prior to the lip filler injection is necessary to find out your expectations so we can plan where to place the injectable and how much is needed. You can bring a picture to the consultation which would make the process of lip enhancement even more perfect.
- You will see the results of your lip fillers immediately – and you can even watch to continuously check that the results will become natural. When people think of making their lips bigger, they often see pictures of unnaturally large lips or duck lips – which will not happen with us. Swelling of your lips will last for 1 – 2 days, and will be subtle. Bruising is very uncommon.

NON-SURGICAL NOSE JOB (LIQUID RHINOPLASTY)

- This is a gentle nose-reshaping procedure, which can now be safely achieved using dermal fillers. Dr Stasch offers this safe, non-invasive alternative to a surgical rhinoplasty, to achieve instant results without the need to endure weeks of swelling and bruising from a nose job operation.
